📖 **README.md**

Aura.Router

Powerful, flexible web routing for PSR-7 requests.

Installation and Autoloading

This package is installable and PSR-4 autoloadable via Composer as aura/router.

Alternatively, download a release, or clone this repository, then map the `Aura\Router\` namespace to the package `src/` directory.

Dependencies

This package requires PHP 5.5 or later; it has been tested on PHP 5.6, PHP 7, PHP 7.1 and HHVM. We recommend using the latest available version of PHP as a matter of principle.

Aura library packages may sometimes depend on external interfaces, but never on external implementations. This allows compliance with community standards without compromising flexibility. For specifics, please examine the package composer.json file.

Quality

Scrutinizer unknown   coverage unknown   build passing

To run the unit tests at the command line, issue `composer install` and then `./vendor/bin/phpunit` at the package root. (This requires [Composer](#) to be available as `composer`.)

This package attempts to comply with [PSR-1](#), [PSR-2](#), and [PSR-4](#). If you notice compliance oversights, please send a patch via pull request.

Community

To ask questions, provide feedback, or otherwise communicate with other Aura users, please join our [Google Group](#), follow [@auraphp](#), or chat with us on Freenode in the #auraphp channel.

Documentation

This package is fully documented [here](#).

There is also a video demonstration on [YouTube](#):
